                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to the human zacrp3 protein (AAB29580) and to CC nucleic acids which encode it (AAC64058, AAC64063). Zacrp3 is a homogue cc of adipocyte complement related protein (ACRP30) and contains a CC collagen-ilke domain comprising Gly-Xaa-Xaa or Gly-Xaa-Pro repeats, and a CC cterminal Clq domain comprising 10 beta-strands. The zacrp3 gene is CC located on chromosome 5p12. The invention also relates to zacrp3 gene is CC located on chromosome containing zacrp3 polypeptides, calls cc zacrp3-specific antibodies, expression constructs and host cells CC comprising zacrp3 nucleic acids, and methods of recombinant production of CC zacrp3. Human zacrp3, and its agonists and antagonists may be used in the CC zacrp3. Human zacrp3, and its agonists and antagonists may be used in the CC anorexia, and conditions associated with these disorders such as obesity and CC anorexia, and conditions associated with these disorders may be useful CC like domain, zacrp3 and zacrp3-containing fusion proteins may be useful CC as antimicrobial agents, promoting lysis or phagocytosis of infectious CC organisms such as bacteria or viruses. Zacrp3, its fragments, fusion CC contains, antibodies and activity modulators may also be used to inhibit collagen. Induced platelet aggregation, adhesion, or activation, and may therefore be treat injury to the vasculature of the relation contains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               of a mammal e.g., to treat injury to the vasculature or other collagenous tissue. Human zacrp3 and its antibodies may additionally be used to study dimerisation and oligomerisation. The present sequence represents cDNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
CC which encode human secretory or membrane proteins represented by

CR AAB88317 - AAB8419. Included in the invention are primers

CA AAF93917 - AAF94295 and AAF62232 - AAF62235 which are used to isolate the

CC CDNA sequences of the invention. The invention also includes methods for

CC the production of antibodies directed against the proteins, and cDNA

CR sequences, which can be used in vaccines. The polynucleotide sequences

CC can be used in gene therapy. The polynucleotide sequences and the

CC proteins they encode may be used in the prevention, treatment and

CC diagnosis of diseases associated with inappropriate secretory

CC protein, membrane protein expression. The nucleic acids and complementary

CC sequences may also be used as DNA probes in diagnostic assays

CC (e.g. polymerrase chain reactions (PCR)) to detect and quantitate the

CC presence of similar nucleic acid sequences in samples. They may also be

CC used to study the expression and function of secretory proteins/membrane

CC polymeptides and their role in metabolism. The polymeptides may be used

CC as antigens in the production of antibodies against them and in assays to

CC identify modulators (agonists and antagonists) of expression and

CC agents to down regulate expression and activity. The antibodies may also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Qy

            The present sequence encodes a secreted or transmembrane polypeptide. The specification describes polypeptides designated PRO1484, PRO1334, PRO1122, PRO1889, PRO18890, PRO1887, PRO1785, PRO4353, PRO4357, PRO4356, PRO4352, PRO4380, PRO4354, PRO4408, PRO5737, PRO4425, PRO5990, PRO60300, PRO4424, PRO44080, PRO4408, PRO5737, PRO4425, PRO5990, PRO60300, PRO4424, PRO44022, PRO4400 and PRO44499, PRO1889 polypeptide is useful for diagnosing tumour in a mammal. The polypeptides, their agonists and antagonists are useful treating a condition associated with expression or activity of the polypeptide. Conditions treated include obesity, diabetes or hyper-or hypo-insulinemia. The polypeptides are capable of inducing proliferation of mammalian kidney mesangial cells and are therefore useful for treating kidney disorders associated with decreased mesangial cell function such as Bergers disease or other contracts of the polypeptides are capable of the polypeptides are capable of inducing proliferation of mammalian kidney mesangial cells and are therefore useful function such as Bergers disease or other capable of the polypeptides are capable of the polypeptides are capable of inducing proliferation of mammalian kidney mesangial cells and are therefore useful function such as Bergers disease or other capable of the polypeptides are capable of the polypeptides are capable of inducing proliferation of mammalian kidney mesangial cells and are therefore useful function such as Bergers disease or other capable of the polypeptides are capable of inducing proliferation of mammalian kidney disorders associated with correct properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel secreted and transmembrane polypeptides useful for diagnosing tumour in a mammal, for identifying agonists and antagonists of the polypeptide and for therapeutic use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  sig_peptide

CC (IMOL) isolated as clone 1890540 from the Incyte BLADTOTO 11brary.

CC (IMOL) isolated as clone 1890540 from the Incyte BLADTOTOTO 11brary.

CC The human IMOLS (AAB15536-B1550) and their encoding polynucleotides

CC (AAA95775-A95789), and compositions comprising them are useful for the

CC diagnosis, treatment or prevention of immunological disorders.

CC infections and cell proliferative disorders associated with decreased

CC expression or activity of IMOL, such as immunological disorders

CC (e.g. inflammation, actinic keratosis, AIDS, Addison's disease),

CC haematopoletic cancer, infections caused by virus (e.g. adenovirus,

CC parvovirus, coronavirus), bacteria (e.g. Staphylococcus, Streptococcus,

CC Shigella), fungi (e.g. Aspergillus, Blastomyces), parasites (e.g.

CC plasmodium, Trypanosoma, intestinal protozoa), cell proliferative

CC disorders (e.g. actinic keratosis, arteriosclerosis, bursitis), and

CC cancers (e.g. actinic keratosis, arteriosclerosis, bursitis), and

CC cancers (e.g. beward, melanoma, sarcoma). The peptides are also

CC specifically recognizes these peptides. The polynucleotides may be used

CC specifically recognizes these peptides. The polynucleotides may be used

                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to the isolation of novel human secre or membrane-associated proteins and the genes encoding them. The sequences of the invention are useful for treating, preventing and ameliorating various diseases such as inflammatory disorders (e.g. asthma), neurological disorders (e.g. dementia), haematopoietic disorders, skeletal developmental disorders, growth abnormalities, neurologenerative disorders (e.g. Huntington's disease), nervous sy disorders, autoimmune disorders (e.g. rheumatoid arthritis), peripheral myelinopathies, viral and bacterial infections, although the peripheral myelinopathies, viral and bacterial infections.
                                                                                                                                                                                                                                                                                                                                                                alpha-mannosidosis, diabetes, cancers, malignant tumours, hyper- and hypotension, obesity, bulimia, anorexia, manic depression, delirium, mental retardation, Tourette's syndrome, schizophrenia, growth, mental or sexual development disorders, and dysfunctions of the blood cascade system including those leading to stroke. ABK35582-ABK3569 represent the genes encoding the novel human secreted or membrane-associated proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel secreted and membrane-associated polypeptides and polynucleotides encoding the polypeptides, for preventing, treating and ameliorating cancers, mental or sexual developmental disorders, and malignant tumours

cancer and neurological diseases and encoding polynucleotide used in the identification polypeptides used for treating inflammatory of genetic

Claim 1; Page 317-318; 352pp; English.

The present polynucleotide encodes a polypeptide which is expressed in mammalian skin cells. The polypeptide is useful for stimulating keratinocyte growth and motility, inhibiting the growth of cancer cells, modulating angiogenesis, inhibiting angiogenesis and vascularisation of tumours, modulating skin inflammation, stimulating the growth of epithelial cells, inhibiting the binding of human immunodeficiency virus (HIV)-1 to leukocytes, and treating inflammatory disease, cancer and neurological diseases. The polynucleotide can be used as a marker, in the identification of genetic disorders, and for the design of oligonucleotides for examining expression patterns.

                                                                                                                                                                                                                      defects, developmental defects and inflammatory diseases. The proteins have important roles in the induction of hair growth, cell proliferation and cell-cell interaction, in maintaining tissue integrity, in wound healing and in modulating immune responses. The present sequence is a cDNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polynucleotides and polypeptides encoded by the polynucleotides isolated from skin cells, useful for treating skin wounds, cancers, growth and developmental defects, inflammatory diseases, or for
                                                                                                                                                                                                                                                                                                                                     The present invention provides the protein and coding sequences of cDN isolated from human, murine and rat skin cell libraries. The sequences can be used in the development of therapeutic agents useful in the treatment of skin diseases, including skin wounds, cancer, growth

Human zacrp3, and its agonists and antagonists may be used in the study and modulation of cellular metabolism and energy balance in mammals, and may therefore be used to treat disorders such as obesity and anorexia, and conditions associated with these disorders. Due to its Clq like domain, zacrp3 and zacrp3-containing fusion proteins may be useful as antinicrobial agents, promoting lysis or phagocytosis of infectious organisms such as bacteria or viruses. Zacrp3, its fragments, fusion proteins, antibodies and activity modulators may also be used to inhibit collagen-induced platelet aggregation, adhesion, or activation, and may therefore have potential for promoting blood flow within the vasculature of a mammal e.g., to treat injury to the vasculature or other collagenous clissue. Human zacrp3 and its antibodies may additionally be used to study dimerisation and oligomerisation. The present sequence represents DNA cereation and oligomerisation. The present sequence represents DNA cereation and oligomerisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            nucleic acids which encode it (AAC64058, AAC64063). Zacrp3 is a homogue of adipocyte complement related protein (ACR930) and contains a collagen-like domain comprising Gly-Xaa-Xaa or Gly-Xaa-Pro repeats, and C-terminal Clq domain comprising 10 beta-strands. The zacrp3 gene is located on chromosome 5p12. The invention also relates to zacrp3 fragments, fusion proteins containing zacrp3 polypeptides, zacrp3-specific antibodies, expression constructs and host cells comprising zacrp3 models as a containing zacrp3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel zacrp3 polypeptides used to treat or prevent bacterial or viral infections, for wound healing, improving blood flow, and to analyze energy efficiency in mammals - \,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cancer and neurological diseases. The proteins may be used to stimulate the growth and motility of keratinocytes, to inhibit the growth of cancer cells, to modulate angiogenesis and tumour vascularisation, to modulate skin inflammation, to modulate epithelial cell growth and to inhibit binding of HTV-1 to leukocytes. The invention may also be used to treat growth and developmental defects, skin wounds and hair follicle disorders. Sequences AZS61606-Z61832 represent cDNA sequences derived from several mouse, rat or human skin cell types. Sequences derived AAZ6166-Z61649, AAZ61725-Z61765, AAZ61802-Z61811 and AAZ61826 encode proteins with an N-terminal signal sequence, indicating that the proteins are secreted. Sequences AAZ61650-Z61688, AAZ6176-Z61812-Z61817-Z61829 encode proteins with one or more putative

                                                                                                                          dermal papilla, human keratinocytes and neonatal foreskin fibroblasts, and mouse embryonic skin, keratinocyte stem cells and transit amplifying cells. Polypeptides of the invention may be used to treat inflammation, cancer and neurological diseases. The proteins may be used to stimulate the growth and motility of keratinocytes, to inhibit the growth of cancer cells, to modulate angiogenesis and tumour vascularisation, to modulate skin inflammation, to modulate epithelial cell growth and to inhibit binding of HIV-1 to leukocytes. The invention may also be used to treat growth and developmental defects, skin wounds and hair follicle disorders. Sequences Az561006-z61802 represent cDNA sequences derived from several mouse, rat or human skin cell types. Sequences Az56106-z61649, Az561725-z61765, Az561802-z61811 and Az561826 encode
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Skin; dermal papilla; keratinocyte; neonatal foreskin fibroblast; embryonic skin cell; keratinocyte stem cell; transit amplifying cell secreted; transmembrane; inflammation; cancer; neurological disease; angiogenesis; tumour vascularisation; growth disorder; developmental disorder; skin wound; hair follicle disorder;

The present polynucleotide encodes a polypeptide which is expressed in mammalian skin cells. The polypeptide is useful for stimulating keratinocyte growth and motility, inhibiting the growth of cancer cells, modulating angiogenesis, inhibiting angiogenesis and vascularisation of tumours, modulating skin inflammation, stimulating the growth of epithelial cells, inhibiting the binding of human immunodeficiency virus (HIV)-1 to leukocytes, and treating inflammantory disease, cancer and neurological diseases. The polynucleotide can be used as a marker, in the identification of genetic disorders, and for the design of oligonucleotides for examining expression patterns.
                                                                                                                                                                                                                                                                                                                                                                                                           New isolated polynucleotide used in the identification of genetic disorders and encoding polypeptides used for treating inflammatory disease, cancer and neurological diseases \cdot

The sequences can be used in the development of therapeutic agents useful in the treatment of skin diseases, including skin wounds, cancer, growth defects, developmental defects and inflammatory diseases. The proteins have important roles in the induction of hair growth, cell proliferation and cell-cell interaction, in maintaining tissue integrity, in wound the protein and in modulating immune responses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    US-10-036-041-2 (1-246) x ABL34815 (1-1123)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention provides the protein and coding sequences of cDNAs isolated from human, murine and rat skin cell libraries. The sequences can be used in the development of therapeutic agents useful in the treatment of skin diseases, including skin wounds, cancer, growth defects, developmental defects and inflammatory diseases. The proteins have important roles in the induction of hair growth, cell proliferation and cell-cell interaction, in maintaining tissue integrity, in wound healing and in modulating immune responses. The present sequence is a cDNA of the invention.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
